

INCIDENT REPORT

Date: 10-16-89

Location: Johnson & Johnston Assoc
130 Route 111
Hampstead, NH 03841

603-329-5691

Contact: Bill McGowen

DRIVER: Wayne Wright

MATERIAL RELEASED: 18-20 gallons 1,1,1 Trichloroethane

Time: 9:05AM

At 9:05, Driver Wayne Wright from Service Chemical was making a product delivery at JJA. The tank is located inside the building quite a distance from the truck. Driver Wright was filling the tank and was positioned inside the building watching the tank gage. An employee in view of the truck noticed the truck leaking and summoned the driver who quickly shut down the truck valve. A gasket had come loose inside the hose, causing the leak.

After shutting down the truck, the truck was secured and Driver Wright estimated 15-20 gallons had been released and had gone down a storm drain located underneath the truck. Driver Wright contacted me at 9:15 and I called NHDES.

Kevin Poulin from Field Services and I proceeded to the site with spill equipment. Officer Steven Hanley from NH Dept of Safety was there along with Chief Hastings of the Hampstead Fire Dept. A Police officer was also on site.

The fire fighters located the end of the drain pipe approx. 100 yds from the drain. After moving the truck, we proceeded to clean out the 8 inch sump located in the drain. I pulled two samples from the end of the drain pipe and sent them back to our laboratory with Driver Wright. We positioned a bucket at the end of the pipe to contain the effluent. One 55 gallon drum of waste sludge from the sump was generated, labeled and marked. JJA is one of our regular waste generators, and we will pick up the waste with their next shipment.

The laboratory called at approx 12:30PM to say that

there was no indication of 1-1-1 trichloroethane in the samples. We removed the bucket and proceeded back to the NES office. I contacted Dick Flanders at the NH ground water division and he suggested flushing the drain to remove any additional contamination. A field service team was dispatched back to the site to flush the drain, collect the effluent and pull additional samples. This task was completed by 4:00PM. Two drums of waste water were labeled and marked and will be picked up with the customers next pick up at no charge. The samples of the effluent after flushing were analyzed and again no contamination was found.

FOLLOWUP 10-17-89

A meeting was held at 8:00AM to discuss the incident, specific followup will include:

- written procedures for off-loading at customers;
- two man offloading;
- use of drain mats; and
- inspection of gaskets.
- all samples sent to Alpha for verification
